

Stationhouse

Stationhouse is an open platform where developers anywhere collaborate on frontier AI research. We want to create a community of 10k+ open source AI developers. We are lowering the barrier for access to frontier AI research by enabling collaboration on complex research projects, completely in the open. Though we are starting with tightly scoped research projects, our end goal is to get to end-to-end base model training.

The Problem

There are more people who should be working on frontier AI research than currently have the opportunity to. This opportunity is gated primarily by access to compute, not by talent or skill. As agents increasingly take on the burden of implementation, research work shifts towards asking the right questions. Today, frontier research questions are asked almost entirely inside a handful of labs and universities.

The Solution

Stationhouse is creating the town square for students, engineers, and researchers to find interesting research projects. The entire process and finished products are in the open. Coordinating humans to work together is a difficult but tractable problem. Open source contributors cite task allocation, understanding project priorities, and finding the resources to complete tasks as common problems. Our platform takes on the role of the maintainer but emphasizes reliance on contributors to engage in the research process. We offer end-to-end project support for research questions, an engaged community wishing to tackle these questions, and a commitment to keeping research transparent, open, and free.

What We Are Looking For

Stationhouse is looking for project sponsors and partners who want to support open source AI projects. This does not have to be funding, but it could come in the form of specific research projects, compute for open-ended exploration, and support on community education. We are also interested in connecting with technical product organizations seeking new customers to try their platforms and AI companies looking to recruit top talent.

Where We Are Now

Stationhouse is running its first design pilot for [the platform](#). The initial project is [ConspiracyBench](#), a benchmark and hillclimbing research project to determine how hard it is to teach AI models facts that they should not believe. The first 35 users come from all over the world: the US, India, Korea, and many more countries. The core contributor group has PhDs, undergrads, and working professionals who all have an interest in contributing to AI research.
